

# 5 Reasons Why “Trump’s Space Force” is a good idea

American President Donald Trump has never failed to astonish people with his startling statements. This time he has come up with the SPACE FORCE!!!

Your mind may have started to play star wars movie scenes but WAIT... Not so soon!!!!

Before we start making fun of Trump, let us integrate the reasons on how this can be a successful strategy to apply in Space related operations.

## **1. Figure out the ways to defend the Earth from Space junks**

Space junks are not like the junks which we throw at bins. Those junks scare us by falling into Earth with the unpredictability of which place or on whose head will it fall. Space Junks may damage nearby satellites and may hinder signals which are essential for communication. It is necessary to figure out in what ways we can tackle them from creating potential damage. Space force might be helpful in the operations related to destroying or changing the path of space junks by tying up with NASA.

## **2. Increase collaboration with nations to protect space-based assets**

Space Force cannot solely handle research. It needs the support of other countries to preserve space-based assets such as intelligence satellite, communication satellites, weather forecasting, weapon command and control satellites. This will help to strengthen the relationship of other countries with the US and ensure harmony between them.

## **3. Ease Of Administration**

The Air Force is taking care of Airforce and Space research together as of now in the US. Fragmenting the department may help with administration easier than now, though it sounds like more time and money will be shed here. When needed both forces can join hands and work as a team.

## **4. Strengthens US space system**

Chinese military thinker Wang Chen has commented that the easiest way to defeat the US is through fighting from space as the US space system is weak. By starting Space Force, US can strengthen its hand in space research and achieve beyond the galaxy in space defence.

## **5. Updating The Technology for Life Beyond Earth**

Constant research is needed to assure life beyond the Earth. Right now it is a rat race between the US, Russia, and China on who is going to build a life on Moon and Mars. There are challenges like improving technology, increasing capability of life and using of resources in both Moon and in Mars.

Hence starting Space Force will indeed be a welcome step to widen the horizon of research of making life possible beyond Earth.

The right person cannot always say the right, and the wrong person cannot tell wrong all the time. What we should mind is how practical will it be if it is applied and how it improves and safeguards our life.
